

# Idenprotect Go

## The identity-driven secure enterprise browser

Still using the same insecure web browser as everyone else? Why?

Idenprotect authenticates every user by default before they get anywhere near your data.

**No passwords. No workarounds. No compromise.**

### ENTERPRISE GRADE

Supporting enterprise protocols and features, enabling a simpler integration to many applications.

### PUTTING IDENTITY FIRST

No more passwords, no more confusion, no more fuss, just seamless access with blistering performance.

### LIGHTWEIGHT AND SIMPLE

No gimmick features. No unnecessary bolt-ons. Just the things that most people need to browse conveniently.

## Idenprotect Go: The only choice for secure browsing for enterprise.

As a business, you know security matters. You go to extreme lengths to lock down every attack surface. You educate employees on how not to get phished. You try to think of everything.

Except you're still using the same insecure browser as everyone else. Sure, you've tried to protect it with endless add-ons and plug-ins. But all this does is slow users down, causes overheads and offers little protection. But what's the alternative?

## The enterprise browser challenge

The browser has become a vital tool for every business. Of course, today, the browser isn't just a way for employees to keep up to date, it's fundamental to how they access mission-critical data and resources.

All consumer-grade browsers lack the enterprise features required to connect business users to data. Most authentication is password-driven and patchy. And for IT management is a never-ending headache.

Idenprotect Go was built from the ground up for the needs of today's modern enterprises. It uses advanced phishing-resistant authentication to ensure that a user is exactly who they say they are. It removes passwords to eliminate one of the main sources of compromised credentials.

Idenprotect Go can be centrally managed, giving IT security pros granular control regardless of whether it's on a company-owned PC or a privately-owned mobile device.

Ultimately, with Idenprotect Go, your people can spend more time doing what matters and you can spend less time worrying about where the next phishing attack or browser exploit will come from.

## Key Statistics:

Around 1.5 million new phishing websites are created every month

83% of enterprises experienced a phishing attack in the last 12 months

61% of people admit using the same password across their applications

An 30% increase in push or push fatigue attacks identified across the industry

## Going beyond consumer browsers and VPNs

Idenprotect Go offers a unique way to help organisations align to the 'never trust, always verify' cyber security approach while securing the ubiquitous nature of modern enterprises.

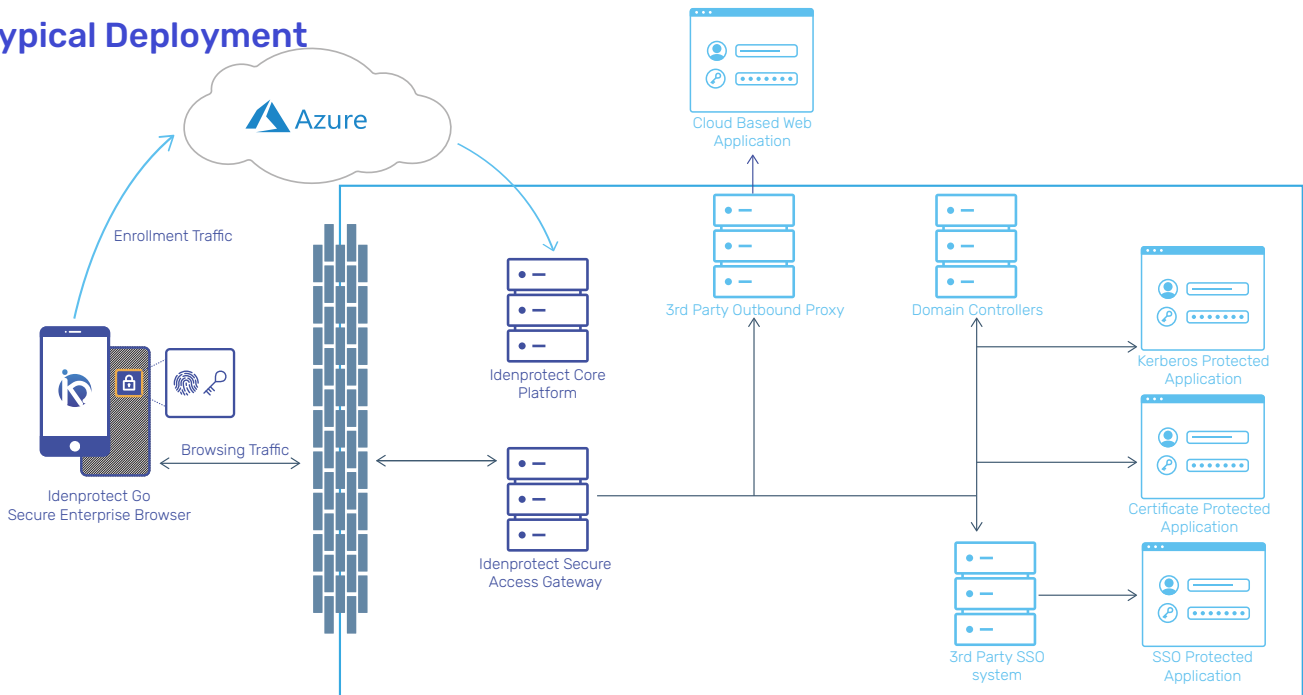

Many enterprises recognise that legacy and perimeter-based security are no longer suitable to protect their businesses or ensure the modern adoption of IT services. The main driver behind this is that not all business data is protected behind the secure confines of their firewalled data centres. The growth of cloud computing and digital transformation has shifted from the status quo and the need to secure increasingly multi-connected technology environments is essential as data now resides in both private data centres and public cloud networks.

The Zero-Trust concept is a framework that commits to the elimination of implicit trust. It replaces the implicit trust with a risk-based approach that verifies continuously when each request or connection is made, ensuring least privilege principles with granular access controls to IT resources can be enforced.

### Idenprotect Go - Enterprise Browser Features

- Proxy PAC file ready
- Mutual TLS technology - No VPN
- Kerberos ready and supported
- Logs and diagnostic settings and central uploads
- Secure Enclave/TEE/TPM Enforced
- Microsoft Intune and Conditional Access policy ready.
- DLP controls via Intune and Endpoint Manager
- Bookmark management
- Web history and management
- Bookmark Sync and backup
- Tabs and Tab management
- Clear cached data
- Homepage management
- Diagnostics and logging
- Unenroll Option
- Light and Dark Theme
- Credential life-cycle management
- Search for Text
- Select Search Engine

## Typical Deployment

### Ready for Enterprise

Idenprotect Go supports enterprise protocols and services such as Kerberos, MTLS, Proxy-Auto Config files and in addition, can be managed via Microsoft Intune and conditional access policies.

### Total Security

Idenprotect Go ensures that the user's identity is validated first before starting the Idenprotect secure tunnel, a non-VPN based connection that delivers on speed and security, ensuring corporate resources can be accessed safely.

### Strong and simple access

Idenprotect's award-winning phishing-resistant, passwordless technology with device biometrics, ensures users will no longer need to use passwords or authenticators to gain access to corporate resources whether on-premise or in the cloud.
